

A DIFFERENT KIND OF GARDEN TOUR

Sponsored by
*Middletown Pollinator
Pathway*
Saturday, September 16
10:00 - 2:00

(Rain date September 17, same time)

Just because it's September and your gardens look sleepy doesn't mean the action stops! Bees need to forage until frost, butterflies need sustenance to mate, hibernate, or migrate, and caterpillars feed until they "wrap up" for the winter.

The photo above features one of the many beautiful native plants that bloom in late summer and early fall. Middletown Pollinator Pathway invites you to visit several local properties to learn more about the plants, the sites, the work involved in transitioning your yard, and the many ways even a small garden can become a more natural oasis for our friendly pollinators.
